Leadership development
An evidence review
The CIPD has been championing better work and working lives for over 100 years. It helps organisations thrive by focusing on their people, supporting our economies and societies. It’s the professional body for HR, L&D, OD and all people professionals – experts in people, work and change. With almost 160,000 members globally – and a growing community using its research, insights and learning – it gives trusted advice and offers independent thought leadership. It’s a leading voice in the call for good work that creates value for everyone.
Leadership development: An evidence review

Acknowledgements

This report was originally funded by ACT Health. It was written by Eric Barends, Denise Rousseau, Barbara Janssen, Alessandra Capezzio and Cedric Velghe of the Center for Evidence-Based Management (CEBMa).

About CEBMa

The Center for Evidence-Based Management (CEBMa) is the leading authority on evidence-based practice in the field of management and leadership. It is an independent non-profit foundation providing support and resources to managers, leaders, consultants, facilitators or instructors, academics and others interested in evidence-based practice and decision-making. It enjoys the support of prominent universities including Stanford, Carnegie Mellon, the Australian National University, and the Free University of Amsterdam.

1 Introduction

Rationale for this review

Good people managers are an essential component of organisational success, and leadership training is seen as an important way in which to develop and enhance the capabilities of managers. However, such training varies considerably in its focus, delivery and effectiveness. For this reason, we conducted an evidence review to understand what is known in the scientific literature about the attributes of effective leadership training programmes.

What is a rapid evidence assessment?

Evidence reviews come in many forms. One of the best known is the conventional literature review, which provides an overview of relevant scientific literature published on a topic. However, a conventional literature review’s trustworthiness is often low: clear criteria for inclusion are often lacking and studies are selected based on the researcher’s individual preferences. As a result, conventional literature reviews are prone to bias. This is why we use ‘rapid evidence assessments’ (REAs). REAs use a specific research methodology to identify the most relevant studies on a specific topic as comprehensively as possible, and select appropriate studies based on explicit criteria. In addition, the methodological quality of the studies included is assessed by two independent reviewers. In contrast to a conventional literature review, an REA is transparent, verifiable and reproducible, and, as a result, the likelihood of bias is considerably smaller.

Main question: What does the review answer?

What is known in the research literature about the effectiveness of leadership training programmes? In addition, what are the characteristics of effective leadership training programmes?

Other issues that follow from these questions are:

1. What is leadership?
2. How can leadership be measured?
3. What is the effect of leadership training?
4. What are the characteristics of effective leadership training programmes?

2 Methods

Search strategy: How was the research evidence sought?

The following four databases were used to identify studies: ABI/INFORM Global, Business Source Premier, PsycINFO and the database of the Education Resources Information Centre (ERIC). The following generic search filters were applied to all databases during the search:
Leadership development: An evidence review

1 scholarly journals, peer-reviewed
2 published in the period 1980 to 2023 for meta-analysis and 2012 to 2022 for controlled and/or longitudinal studies
3 articles in English.

A search was conducted using combinations of different search terms, such as ‘leadership’, ‘management’, ‘training’ and ‘development’. We conducted 53 different search queries and screened the titles and abstracts of more than 700 studies. An overview of all search terms and queries is provided in Appendix 1.

The search was first conducted for an evidence review in 2013. This was then re-run to update the review with studies published since then in 2020 and again in 2022.

Selection process: How were studies selected?

Study selection took place in two phases. First, the titles and abstracts of the 700+ studies were screened for their relevance to this REA. In case of doubt, lack of information or disagreement, the study was included. Duplicate publications were removed. This first phase yielded 25 (2013), 21 (2019) and 15 (2022) studies. Second, studies were selected based on the full text of the article according to the following inclusion criteria:

1 type of studies: only quantitative, empirical studies
2 design: only meta-analyses and controlled/longitudinal studies
3 measurement: only studies in which relationships between learning outcomes, contextual factors, antecedents and leadership training were quantitatively measured
4 context: only studies related to workplace settings.

This second phase yielded 17 studies (in 2013), plus 14 studies (2020) and 12 studies (2022), making a total of 43. An overview of the selection process is provided in Appendix 2.

Data extraction: What data was extracted?

Data extraction involves the collation of the results of the studies included. From each study we extracted and interpreted information relevant to the review question, such as year of publication, research design, sample size, population (eg industry, number of employees), possible moderators or mediators, main findings, effect sizes and limitations. An overview of all studies included is provided in Appendix 3.

Critical appraisal

In almost any situation, it is possible to find a scientific study to support or refute a theory or a claim. Thus it is important to determine which studies are trustworthy (ie valid and reliable) and which are not. The trustworthiness of a scientific study is first determined by its methodological appropriateness. For cause-and-effect claims (ie if we do A, will it result in B?), a study has a high methodological appropriateness when it fulfils the three conditions
required for causal inference: co-variation, time-order relationship and elimination of plausible alternative causes (Shaughnessy and Zechmeister, 2006).

A study that uses a control group, random assignment and a before-and-after measurement is therefore regarded as the ‘gold standard’. Non-randomised studies and before-after studies come next in terms of appropriateness. Cross-sectional studies (surveys) and case studies are regarded as having the greatest chance of showing bias in the outcome and therefore fall lower in the ranking in terms of appropriateness. Meta-analyses in which statistical analysis techniques are used to pool the results of controlled studies are therefore regarded as the most appropriate design.

To determine the methodological appropriateness of the included studies’ research design, the classification system of Shadish et al (2002), and Petticrew and Roberts (2006) was used. The following four levels of appropriateness were used for the classification:

<table>
<thead>
<tr>
<th>Design</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Systematic review or meta-analysis of randomised controlled studies</td>
<td>AA</td>
</tr>
<tr>
<td>Systematic review or meta-analysis of controlled before–after studies</td>
<td>A</td>
</tr>
<tr>
<td>Randomised controlled study</td>
<td></td>
</tr>
<tr>
<td>Systematic review or meta-analysis of non-controlled and/or before–after studies</td>
<td>B</td>
</tr>
<tr>
<td>Non-randomised controlled before–after study</td>
<td></td>
</tr>
<tr>
<td>Interrupted time series</td>
<td></td>
</tr>
<tr>
<td>Systematic review or meta-analysis of cross-sectional studies</td>
<td>C</td>
</tr>
<tr>
<td>Controlled study without a pretest or uncontrolled study with a pretest</td>
<td></td>
</tr>
<tr>
<td>Cross-sectional study</td>
<td>D</td>
</tr>
</tbody>
</table>

It should be noted, however, that the level of methodological appropriateness as explained above is only relevant in assessing the validity of a cause-and-effect relationship that might exist between a predictor/driver (organisational culture) and its outcomes (performance), which is the purpose of this review.

In addition, a study’s trustworthiness is determined by its methodological quality (its strengths and weaknesses). For instance, was the sample size large enough and were reliable measurement methods used? To determine methodological quality, all the studies included were systematically assessed on explicit quality criteria. Based on a tally of the number of weaknesses, the trustworthiness was downgraded, and the final level determined as follows: a downgrade of one level if two weaknesses were identified; a downgrade of two levels if four weaknesses were identified, etc.
Finally, the effect sizes were identified. An effect (e.g., a correlation, Cohen’s d or omega) can be statistically significant but may not necessarily be of practical relevance: even a trivial effect can be statistically significant if the sample size is big enough. For this reason, the effect size—a standard measure of the magnitude of the effect—of the studies included was assessed. To determine the magnitude of an effect, Cohen’s rules of thumb (Cohen, 1988) were applied. According to Cohen a ‘small’ effect is an effect that is only visible through careful examination. A ‘medium’ effect, however, is one that is ‘visible to the naked eye of the careful observer’. Finally, a ‘large’ effect is one that anybody can easily see because it is substantial.

Critical appraisal: What is the quality of the studies included?

The overall quality of the 43 studies included in this review is moderate to high: 26 studies were graded level B or higher. An overview of all the studies included and information regarding year of publication, research design, sample size, population, main findings, effect sizes and limitations is provided in Appendix 3.

3 Main findings

Question 1a: What is leadership?

In the domain of management and organisations, the term, ‘leadership’ is a popular term. In management books as well as in the scientific literature, the effect of leadership is widely discussed and studied. Amazon offers thousands of management books with ‘leadership’ in the title, and the research database ABI/INFORM contains more than 15,000 peer-reviewed papers on this topic. In fact, both scholars and practitioners view leadership as an important, if not fundamental, driver for organisational performance (Pfeffer, 2015). Despite the large number of publications, however, there is no consensus of what ‘leadership’ entails. As a result, there are many definitions of leadership available. For example, the Oxford English Dictionary defines leadership as “the ability to be a leader or the qualities a good leader should have”, whereas Wikipedia refers to leadership as “a process of social influence in which a person can enlist the aid and support of others in the accomplishment of a common task”.

Sometimes the term ‘leadership’ is limited to “personal influence resulting in enthusiastic commitment of followers” (Schyns, 2013). For example, some management thinkers simply define leadership as “the capacity to translate vision into reality” (Warren Bennis), or “empowering others” (Bill Gates). In addition, there is an ongoing controversy regarding the distinction between leadership and management. Conventional wisdom has it that managers are concerned with how things get done, whereas leaders build commitment and vision (Kotter, 1990). However, as Yukl (1989) stated: “Nobody has proposed that managing and leading are equivalent, but the degree of overlap is a point of sharp disagreement (Collins, 2002).” In this review, however, the terms ‘leadership’ and ‘management’ are used interchangeably.

The lack of a widely accepted definition of leadership and what it entails complicates research on the effect of leadership training programmes. Leadership training programmes use
a plethora of definitions and core attributes of leadership, which makes a robust and comparable evaluation of their impact difficult.

**Question 2: How can leadership be measured?**

There are many assessment tools and questionnaires available that claim to measure leadership. Most of these tools focus on a specific element or type of leadership, such as the Leadership Style Questionnaire (Northouse, 2011) and the Servant Leadership Behaviour Scale (Sendjaya, 2008). A recent systematic review that evaluates the psychometric properties of 17 leadership scales found that the majority lack some degree of rigor. Partly for this reason, most studies included in this review don’t measure leadership as such, but rather evaluate the impact (transfer) of leadership training programmes by using Kirkpatrick’s model (Collins, 2001; Frich, 2015). Kirkpatrick’s assessment model comprises four levels, presented as a sequence:

1. reaction: what participants think and feel about the training programme
2. learning: the resulting increase in knowledge, skills and change attitudes
3. behaviour: the resulting change in practice and behaviour
4. results: the resulting organisational benefits (eg performance, service delivery, clinical outcomes).

**Question 3: What is the effectiveness of leadership training programmes?**

Finding 1: Overall, leadership training has a moderate positive effect, but this effect varies across participants and settings (level AA)

Finding 2: The effectiveness of leadership training has somewhat improved over the past decades (level A)

Finding 3: The effects of leadership training remain stable over time (level A)

Overall, leadership training and development programmes have a moderate positive effect on a wide range of outcomes (Au, 2005; Avolio, 2009; Baron, 2016; Cohrs et al, 2020; Collins, 2004; Eden et al, 2000; Lacerenza, 2017; Mesmer, 2010; Middleton et al, 2019; Reyes, 2019; Seeg et al, 2022; Taylor et al, 2009). This result is largely replicated across studies irrespective of the source of evaluation (self, superior, peer or subordinate ratings) or study designs (meta-analyses and controlled/longitudinal studies). Surprisingly, although there have been numerous innovations in leadership theory and training techniques, the effectiveness of leadership training seems to have only slightly improved over the past 20 years (Lacerenza, 2017; Powell and Yalcin, 2010). The effects on learning outcomes, however, tend to be larger than the effects on performance outcomes (Frich, 2015; Taylor et al, 2005).

There are some indications that the effect of leadership training may be more effective in public organisations (An et al, 2019) and may have a slightly larger impact for female managers than for male managers (An and Meier, 2021). In addition, it was found that the effect of leadership training is subject to diminishing returns - that is, managers who already use good leadership techniques are unlikely to gain as much from additional training as those who do not use these techniques (An and Meier, 2021; An et al, 2019; Cohrs et al, 2020).
Finally, a meta-analysis of randomised controlled studies showed that, although effects on declarative knowledge decayed over time, training effects on skills and leadership behaviour remain stable or even increase (Taylor et al, 2005). This finding was confirmed by a recent longitudinal study that found strong positive long-term effects regarding the transfer of leadership behaviour (Seeg et al, 2022).

**Finding 4: The evidence on the economic return on investment of leadership training is unclear (level B)**

The studies included in this REA provide limited information on the economic utility or return on investment (ROI) of leadership training. A meta-analysis that attempted to calculate the ROI of leadership training cautioned that the financial returns are unclear, especially for higher-level managers and leaders (Morrow et al, 1997). It is therefore recommended by some authors to limit the expenses through, for example, controlling additional expenses such as travel and accommodation, and avoiding expensive ‘high-end’ training.

**Question 4: What is the effectiveness of leadership training programmes?**

The studies included in this review show a large variation of effectiveness of the training programmes. These findings suggest that the effect of leadership training is moderated and/or mediated by several factors, such as delivery and implementation characteristics (Lacerenza, 2017; Morrow et al, 1997). Below, an overview of moderators and mediators is provided.

**Finding 5: Leadership training programmes with the following characteristics tend to be more effective**

**Start with a ‘training needs analysis’ (level B)**

Regarding the training or learning content of leadership training programmes, the studies included in this review indicate that a careful training needs analysis (eg through a survey, interview, focus group, critical incidents) before the start of the programme tends to increase its effectiveness (Lacerenza, 2017; Leskiw, 2007; Mesmer, 2010; Salas, 2012, Seeg et al, 2022; Taylor et al, 2005). More specifically:

1. Programmes designed on the basis of an analysis of tasks and skill requirements and skills gaps are more effective than generic untailored programmes.
2. ‘Training needs’ analysis has a positive impact on the motivation of trainees to learn.
3. Learning transfer is greater when trainees set clear and specific learning goals.

**Focus on general management skills and (soft) interpersonal skills (Level B)**

A meta-analysis of controlled studies (Taylor et al, 2009) indicates that skills that seem to transfer best to leader behaviour seem to be general management skills (eg goal-setting, performance appraisal, time management) and, to a lesser extent, interpersonal skills (eg listening, questioning, negotiating, mentoring). However, it was found that ‘off the shelf’ courses provided by private training providers in the UK often show serious omissions when it comes to teaching these skills (Yeardley, 2017).

**Duration and repetition (level A)**
In relation to design, several meta-analyses and high-quality studies indicate that leadership training and development programmes should be of reasonable length (at least three days or longer) and repeated periodically to be effective (e.g., Lacerenza, 2017; Taylor et al., 2005). In addition, leadership training programmes with spaced distribution are more effective than one-off trainings (Au, 2005). However, long and complex courses may not be required to achieve positive change; short (several days), punchy courses with clear objectives may well be as effective (Lyons, 2018; Reyes, 2019).

**Use multiple learning and evidence-based instruction methods (level A)**

Several studies report that effective training programmes are characterised by the use of a combination of didactic learning, tutorials and reflective learning (Lyons, 2018). In addition, these programmes tend to use multiple instruction methods, such as lectures, group work, and action learning projects (Frich, 2015; Lacerenza, 2015; Steinert et al., 2012). In addition, it was found that training with an evidence-based design not only has larger short-term effects but also tends to be more effective in the long term (Seeg et al., 2022). An overview of evidence-based principles and a checklist can be found in Salas (2012, tables 2 and 3).

**Provide opportunity to practise (level A)**

Although the use of multiple methods tends to be effective, the training programme should clearly include opportunities for practice, linked to real-world situations or trainee-generated scenarios (Frich, 2015; Lacerenza, 2015; Mianda, 2018; Steinert et al., 2012; Seeg et al., 2022). This type of training is often referred to as ‘experiential’, ‘problem-based’ or ‘action’ learning. In fact, in the domain of evidence-based education, there are a large number of studies that show, in general, experiential learning tends to be more effective than traditional learning, especially when it concerns the teaching of practical skills, soft skills and vocational knowledge (Lista et al., 2022). For example, several systematic reviews and longitudinal studies indicate that courses that include (simulations of) real-life situations and social interaction yield better outcomes and have a larger (positive) effect on students’ performance when compared with traditional teaching methods (Baron, 2016; Boet, 2014; Fung, 2015; Norman, 2012; Zelechowski, 2017). It was found, however, that the positive effect of experiential learning is mediated by participants’ perceptions of psychological safety (Cajiao and Burke, 2016; see also below).

**Create a safe learning climate and provide recognition and support (level A)**

For leadership training and development programmes to be effective, it seems important, as is the case for other forms of training, to create and maintain a safe learning climate that supports the transfer to the workplace of what was learned. Recognition, feedback, mentorship and support from the organisation and the supervisor or peers for acquiring and applying new skills can motivate trainees to transfer what they learned to their day-to-day work behaviour (Lacerenza, 2017; Leskiw, 2007; Steinert et al., 2012; Taylor et al., 2005). As such, leadership training should not be treated as a one-shot event. On the contrary, leadership development should be strongly and systematically integrated and communicated in the workplace climate and processes.
4 Conclusion

Leadership training programmes are effective, but this effect is contingent on various design, delivery, and implementation characteristics. This REA supports the use of needs analysis, a focus on general management skills and interpersonal skills, multiple delivery methods, opportunity to practise, spaced training sessions and organisational support.

Limitations

This REA aims to provide a balanced assessment of what is known in the scientific literature about the characteristics of effective leadership training programmes by using the systematic review method to search and critically appraise empirical studies. However, to be ‘rapid’, concessions were made in relation to the breadth and depth of the search process, such as the exclusion of unpublished studies, the use of a limited number of databases and a focus on meta-analyses and controlled/longitudinal studies published in the period 1995 to 2022. As a consequence, some relevant studies may have been missed.

A second limitation concerns the critical appraisal of the studies included, which did not incorporate a comprehensive review of the psychometric properties of the tests, scales and questionnaires used.

Finally, this REA focused only on quantitative studies, that is, studies in which the link between leadership programmes and performance/organisational outcomes was quantitatively measured. For this reason, findings from quantitative studies were not reported. As a consequence, qualitative findings that are relevant for practice may have been missed.

Given these limitations, care must be taken not to present the findings presented in this REA as conclusive.

<tr>
<td>7.</td>
<td>Blume, 2010</td>
<td>Meta-analysis including field and lab studies</td>
<td>Students/managers/non-managerial, mainly USA and Canada</td>
<td>Learning transfer is related to trainee characteristics (eg cognitive ability, experience, personality, motivation), work environment factors (ie support, climate, constraints/opportunity), training interventions, learning outcomes (ie knowledge, self-efficacy), and trainee reactions. The predictor-transfer relationships after removing same-source and same-measurement-context (SS/SMC) bias is weaker. Regarding transfer measurement, predictor-transfer relationship is stronger in the case of (a) no time lag between training and the transfer measure, (b) self-measures compared with non-self (ie 1) See table 1 for complete overview. Examples: Cognitive ability $\rho=.37$ Neuroticism $\rho=-.19$ Post-training self-efficacy $\rho=.22$</td>
<td>Concrete and elaborate information on the variables is lacking. Large number of variables</td>
<td></td>
</tr>
</tbody>
</table>
Leadership development: scientific summary

4. In general predictor-transfer relationships are stronger for open than for closed skills.

5. Predictor-transfer relationships are stronger in the laboratory context for cognitive ability and post-training self-efficacy; for pre-training self-efficacy, motivation, post-training knowledge and goal-setting the relationship is stronger in the field context.

6. For all predictors except post-training knowledge the predictor-transfer relationships were stronger in a published than an unpublished study.

7. The longer the length of time between training and the transfer measure the weaker the predictor-transfer relationships for (a) post-training knowledge and (b) post-training self-efficacy but not for (c) pre-training self-efficacy, (d) motivation and (e) work environment (ns).

8. There is a moderate relationship between trainees’ rating versus (a) supervisor’s and (b) peers’ assessment of transfer and (c) a large relationship between measures at different times by the same source.

---

Example: Post-training self-efficacy

\[ SS/SMC \rho = .46 \] Not

\[ SS/SMS \rho = .20 \]

3) See table 2. a) Example post-training self-efficacy Time lag

\[ \rho = .11 \] no time lag

\[ \rho = .38 \]

b) Example Motivation

Self \[ \rho = .33 \]

other/objective \[ \rho = .11 \]

c) Example

Motivation Use \[ \rho = .36 \]

Effectiveness \[ \rho = .10 \]

| 8. Brown, 2016  | Quasi-experimental study (randomisation at the group level) | n=172 | 1. Participants who set behavioural outcome goals, behaviourally specific goals, and rank-ordered behavioural goals have NO higher learning transfer (based on self and workplace observer behavioural observation scales) relative to those urged to do your best.*  
2. Participants who set behavioural outcome goals, behaviourally-specific goals, and rank-ordered behavioural goals have NO higher learning transfer (assessed using self-report surveys) relative to those urged to do your best. Thus, providing managerial development participants with the list of key behaviours via behavioural observation scales, and then urging them to do their best to use these back at work, may be sufficient to enhance efficacy and transfer.  
*Note: In fact, there was some evidence to the contrary: do-your-best participants had higher transfer than those who set rank-ordered behavioural goals or behaviour-specific goals. |

| 9. Cajiao, 2016 | Quasi-experimental study | n=246 | 1. As the instructional method includes greater social interaction** and reflective activities, students’ reflective and dialogical activities increase.  
2. Students’ perceptions of psychological safety partially mediates the relationships between instructional method and students’ reflective and dialogical activities.  
* the leadership course was offered over a 16-week period  
** low social interaction=lecture only with reading assignments; high social interaction=use of role-plays, managerial simulations, projects, and carefully structured experience-based exercises. |

| 17. Edelman, 2017 | Randomised controlled study n=31 individuals holding a leadership position for at least a year in the public or private sector | 1. Emotional regulation training* increases leader use of deep acting  
2. Emotional regulation training increases leadership effectiveness.  
3. The effect of emotional regulation training on leadership effectiveness is mediated by deep acting.  
4. Emotional regulation training increases leader positive affective displays in interactions with their subordinates.  
5. The effect of emotional regulation training on leadership effectiveness is mediated by positive affective displays.  
* Concerned a three-hour training aimed to develop deep acting skills (included practice in participants’ own organisation). | effect sizes unclear | effect size unclear | A |
| 18. Eden, 2000 | Meta-analysis of RCTs k=7 various | Small to moderate overall effect. | not reported | no serious limitations | A |
| Frich, 2015 | 19. Frich, 2015 | Systematic review of longitudinal and controlled studies \( k=45 \) | Physicians | Not reported | Limited search |

1. The studies showed considerable heterogeneity concerning conceptual frameworks, teaching and learning methods, educational content, evaluation design, and outcomes measured.

2. All 45 studies reported positive outcomes, but few studies reported system-level (4) effects, such as improved performance on quality indicators for disease management or increased customer satisfaction.

3. Our findings suggest that the leadership programmes described in the medical literature focus more on the ‘know’ and ‘do’ elements of leadership than the ‘be’ component, which some argue is fundamental in attaining the capacity to lead.

4. It was found that the literature on physician leadership development has been centred on imparting conceptual knowledge to physicians as individuals, for which lectures and seminars may be suitable, and has directed fewer resources to efforts in building self-awareness, for which action-based learning, feedback and self-development activities may be more appropriate.

5. Importantly, the few studies that documented favourable organisational outcomes, such as improvement in quality indicators for disease management, were characterised by the use of multiple learning methods, including lectures, seminars and group work, and involved action learning projects in multidisciplinary teams. The implication of this finding is that greater investment in programmes using teamwork and multiple learning methods is likely to have the largest impact around leadership development for physicians.

| Reichard, 2017 | Cross-sectional and (quasi) longitudinal study | n=73, 94 and 49 organisational leaders from non-profit agencies in the Midwestern United States | 1. Leader developmental efficacy* (LDE) is positively related with intentions to engage in leader self-development activities.  
2. Intentions to engage in leader self-development activities positively mediate the relationship between LDE and implementation of leader self-development activities.  
3. LDE is not positively related to increases in leader efficacy during leader development.  

* LDE=one’s belief in his/her ability to develop leadership knowledge or skills. |
| Reyes, 2019 | Meta-analysis | (k=73, n=5654) students in higher education, including exec programmes | 1. Leadership development programmes have a positive effect on trainee learning outcomes (H1a) and transfer (H1b).  
2. Voluntary leadership development programmes enhance trainee learning (H2a) outcomes to a greater degree than involuntary programmes.  
3. Leadership development programmes spanning multiple training sessions do NOT result in greater effects on learning (H3a) and transfer (H3b) outcomes compared with training programmes with one massed training session  
4. Leadership development programmes incorporating only a practice-based method do NOT lead to greater effects on trainee learning (H4a) and transfer (H4b) outcomes compared with training programmes incorporating both practice- and practice-based methods.

Leadership development: scientific summary

transfer (H4b) outcomes compared with programmes incorporating only information- or demonstration-based methods.

5. Leadership development programmes reporting the use of feedback do NOT display a greater effect on trainee learning (H6a) and transfer (H6b) outcomes compared with programmes that do not report the use of feedback.

6. Face-to-face leadership development programmes with live facilitators do NOT increase positive trainee learning (H7a) and transfer (H7b) outcomes to a greater degree than online, self-administered programmes.

35. Seeg, 2022
Longitudinal study (10 months) n=62

Leaders of a German middle-sized organisation – most held a middle management position.

1. Training with an evidence-based transfer design* not only has (a) positive short-term effects in terms of reactions and learning but also have (b) strong positive long-term effects regarding transfer behaviour (near and far transfer) and results (improved leadership).

2. Near and far transfer is directly predicted by only three transfer determinants (even considering baseline effects): (a) learning, (b) transfer motivation, and (c) transfer opportunity, and learning has the strongest impact on transfer success.

3. An evidence-based transfer training design substantially explains the primary transfer determinants (even considering baseline effects): (a) learning, (b) transfer motivation, and (c) transfer opportunity.

*See Salas, 2012, checklist table and principles of Behaviour Modelling Training.

See practical implications.

1a: transfer motivation r=.34
learning r=.47

1b: near transfer r=.55
far transfer r=.34
lead comm r=.79* .67**

| No serious limitations | D | are drawn on a rather small amount of studies (and small total n) |

More effect sizes in tables 2-6.
Leadership development: scientific summary

| 42. Webb, 2014 | systematic review, \( k = 24 \) | medical students | Overall, evaluation of effectiveness and quality of evidence showed that most curricula did not demonstrate changes in student behaviour or quantifiable results. | not reported | design and quality of the included studies unclear | C |

| 43. Yeardley, 2017 | Quasi-longitudinal study (desk research), \( n = 45 + 20 \) | Courses delivered by private training providers in the UK | Examines the content delivery of courses provided by private training providers (PTPs) for first-level managers (FLMs). It measured, against a contemporary ‘best practice’ soft skill framework, the relevance of ‘off the shelf’ training which aimed at FLMs managerial soft skills, as opposed to ‘technical’ or ‘hard skill’ training. | N.A. | Best practice soft skill framework based on models that are not aimed at first-level managers | C |

Similarly, evaluation of effectiveness and quality of evidence showed that most curricula did not demonstrate changes in student behaviour or quantifiable results.
